

# Philips SpeechExec Enterprise Dictation & Dragon speech recognition

## Version 7

Philips SpeechExec Enterprise is a proved and trusted dictation management system that links professionals and their typists. Unlike any other solution out there, SpeechExec Enterprise is also available with Dragon speech recognition integration and therefore offers over four workflow possibilities making it extremely flexible and adaptable.

Available via the cloud or hosted on your businesses' servers (on-premise), here's what makes it so special:

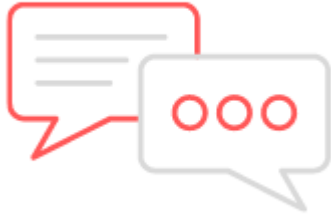

## Two solutions in one - Dragon Professional Anywhere integration

We understand that when it comes to finding a workflow that suits your business, one size doesn't always fit all; Some people may need a traditional dictation workflow using a typist to transcribe, others find speech recognition better, some might need a combination of both or even self-sufficiency – That's what makes SpeechExec Enterprise so flexible, it can do it all!

This new version from Philips allows users to enjoy their own dictation system whereby they can capture, send, and transcribe jobs as well as have full and un-restricted access to Dragon Professional Anywhere!

But what workflow options does SpeechExec offer its users? Let us show you...

# The dictation transcription workflow

This first workflow method is the traditional use for the Philips SpeechExec system.

- The person capturing the notes/documentation (also known as the author) would do exactly that using a voice recorder, the Philips smartphone App or a SpeechMike handheld microphone.
- The author would then send the dictation file to their typist or PA using the SpeechExec dictation system.
- The typist would transcribe the document and request the authors approval of the completed document. This document can also be displayed in the author's smartphone App for easy approval too!

# The back- end speech rec workflow

SpeechExec Enterprises' second workflow option is back-end speech recognition using Dragon Professional Anywhere. It works like this:

- The author captures their documentation in the same way as the transcription workflow method.
- Rather than send it to a typist, they send it through to the Dragon Professional Anywhere.
- The speech recognition engine automatically transcribes the audio-file creating the typed document
- The document and audio are ready for the author to approve and send almost instantaneously or it can be handled by a typist.

## The front-end speech rec workflow

Thirdly, is the ability to dictate in real time within a traditional dictation transcription workflow. This allows an author to dictate with Dragon Professional Anywhere and see their words appear on the screen, they can approve and make revisions in one sitting however there is still the link to a typist where the typist can finish and distribute the document. It works like this:

- The author uses a SpeechMike handheld microphone to dictate into the SpeechExec dictation window.
- The words appear on the screen in real time
- The author can make revision and then approve the text
- The text and the audio are sent to a typist for them to review and format and then distribute

## The pure speech recognition workflow

Lastly, we have the front-end speech recognition workflow that focuses solely around using Dragon Professional Anywhere. It works like this:

- The author uses the Dragon desktop app and a SpeechMike handheld microphone to dictate their words.
- The author can be using any of their desktop applications such as email, Word documents, CRMs.
- The words appear on the screen in real time and the document is formed as they speak.
- The author can then approve the document / email instantly and send it to the desired recipient.

# Benefits of SpeechExec Enterprise 10

## Speech-to-text solution

SpeechExec Enterprise supports a wide range of speech-to-text scenarios. The platform supports traditional dictation workflows between authors and in-house transcriptionists. Recordings and the resulting written documents are automatically routed to the appropriate person for quicker turnaround times. Real-time job status information allows easy tracking of your work and the priority setting assures those urgent recordings get preferential treatment in the queue. Alternatively, users get direct access to Philips SpeechLive transcription service allowing you to outsource urgent transcripts when your staff already has a full workload.

## SpeechExec transcription player

The transcription module allows efficient access to digital voice files. Visual workflow management, including sort, search, and filter options and job information such as author, length and priority, assure productive transcription and fast document turnaround. With the ergonomic Philips Foot Control, all transcription and playback functions can be controlled with the foot freeing up the transcriptionists' hands so they can concentrate solely on typing. Predefined templates can be used, so documents are automatically created with the appropriate header and footer, saving you even more time.

## Speech recognition

Speech recognition software can be seamlessly integrated into the solution. Whether you are dictating directly into the software using a Philips microphone or converting recorded files from a voice recorder, speech recognition will help you to reduce transcription time and costs. Built-in specialized legal and professional vocabulary delivers optimal recognition accuracy. Authors can avoid the tiresome task of reviewing by automatically sending the recognized text and the audio file to their assistant for deferred correction and proofreading. Users can even extend the speech recognition functionality to anywhere they would typically type: office productivity applications, web browsers, and other standard Windows applications.

## Be productive anytime, anywhere

The Philips Voice Recorder App supports you to be productive anytime, anywhere. The app makes it easy to record directly into your iOS or Android mobile device and send the recordings immediately for transcription — whether visiting clients, a job site or your local coffee shop. With SpeechExec Enterprise Web Access you can enjoy a location independent working from any computer with a web browser, e.g. when working from home or during a business trip. Web access allows you to be autonomous from your office equipment and local software installations.

## Highest security

Real-time file encryption (256 bit), password protection and secure file transfer grant only authorized individuals access to documents. The optional automatic backup function protects data against accidental loss.

We're running a half price promotion for a limited time only so if you think SpeechExec Enterprise could be an excellent addition to your business's workflow, please contact us to discuss further and to request pricing.

We'd be more than happy to assess your current workflow and advise how SpeechExec could work for you.
